

40 YEARS ON | GUIYANG, GUIZHOU

# Big data proves boon in Guiyang

Emerging technologies help city make the most of its tough terrain

By **ERIK NILSSON** in Guiyang  
erik\_nilsson@chinadaily.com.cn

Topographically treacherous Guiyang has used innovation to transform its geological disadvantages into advantages, especially during the most recent stage of reform and opening-up.

Its mountains have proved to be development hurdles, sometimes literally, in areas such as transportation infrastructure.

Yet that very geology is now proving to be a boon rather than a bane for the development of Guiyang and surrounding areas in Guizhou province. That is because it is seismically stable, and its altitudes produce relatively steady, cool temperatures year-round, which makes it ideal for big data infrastructure.

Guizhou's data economy grew by 37 percent last year, and its value addition is expected to account for 30 percent of the province's GDP by 2020.

Guiyang has ranked No 1 among provincial capitals in GDP growth for the past five years. Its GDP reached 353.8 billion yuan (\$50.9 billion) last year, about 79 times the 1978 figure based on comparable prices, with annual growth averaging 12.3 percent over the past four decades.

The city's big data is trans-

forming sectors such as agriculture, healthcare and transport cargo across the province, country and world.

Truck driver Gao Dabao said big data collection in Guiyang has changed his life through a single app — Huochebang. He used to find work by driving around shipping centers throughout the country, looking at lists hung on lobby walls to see what goods were being sent when and where, and for what price.

"It was inconvenient and tiring," Gao said. "Now, I just search Huochebang to find cargo to drive. It's easy."

Based in Guiyang, Huochebang is the country's largest shipment information internet platform. It links 5.2 million trucks with 1.25 million users — businesses and individuals — who want cargo transported.

"Our main target is to solve problems in the informatization of truck and cargo matching," said Zhao Qiang, vice-president of Huochebang. "This can lower logistics costs, which benefits all of society."

"We've grown rapidly since we arrived in Guizhou in 2014, when big data was booming. Big data helps us understand more about such areas as trucks and human behaviors. So it empowers the industry."

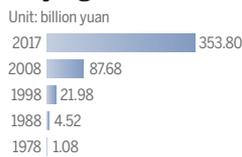

Big data also enables the

establishment of credit systems and conflict mediation, he said, adding: "There were

often disagreements due to a lack of credibility. Drivers are graded according to big data. That can extend to loans."

In the past four years, Huochebang has grown from a small acorn into a unicorn, a startup valued at \$1 billion.

"The market for truck drivers is huge — so huge that it'll be worth more than 1 trillion yuan in the near future," Luo Peng, vice-president of Manbang Group, which owns Huochebang, said in June.

"The domestic logistics supply is very fragmented. China now has around 1.5 million logistics companies and tens of millions of truckers. As an industrial internet platform, we need to ramp up resources to better serve the drivers via emerging technologies such as big data and artificial intelligence."

Guiyang ranks in the top 10 Chinese cities for computing power, according to the 2018 China AI Computing Power Development Report released at the 2018 AI Computing Conference in Beijing in September.

Industry investment has

increased tenfold in the past year, while the computing power of artificial intelligence has grown by 230 percent and the amount of data has expanded by 50 percent.

Big tech giants such as Apple, Qualcomm, Huawei, Tencent, Alibaba and Foxconn have regional headquarters in the city as well as cloud-computing and big data centers.

Per capita disposable income in Guiyang's urban area was 32,186 yuan last year, up by 11.9 times in real terms compared with that of 1980, with annual growth averaging about 7.2 percent.

The figure for rural areas was 14,264 yuan, 12.2 times more than in 1980 in real terms, with an annual average growth of about 7.2 percent.

Looking ahead, Guiyang seems poised to expand the data industries that transform its geology from a stumbling block into a launchpad in the next stages of the reform and opening-up in the new era.

# Nature drive puts city on green track

By **ERIK NILSSON** and **YANG JUN** in Guiyang

Environmental volunteer Lei Yueqin can recall what the Nanming River, which flows through Guiyang, Guizhou province, was like in the early 1950s. It was so pristine, she said, that people would use its water directly for drinking, cooking and washing.

"Kids would swim and catch fish in the river," the 81-year-old said.

But the waterway — a tributary of the Yangtze River — was quickly polluted by the increase in manufacturing emissions and household sewage that came after reform and opening-up brought economic growth.

"The river was dirty and dark by the end of the last century," Lei said. "The fish couldn't survive. And it stank."

Lei has worked as a volunteer to patrol the Nanming since she retired in 1984. "I used to be able to walk about 15 kilometers a day," she said. "But I'm older now. I can only do 3 or 4 km at a time."

The retiree has drawn six maps by hand over the years, recording the water's color and odor, and pollution sources at various locations. She said eight factories, including a paper mill, coal-fired generators and a tannery, once operated along the river, pointing to a map she drew in 1994.

"The factories were relocated. But the pollution remained in the coming decade," she said.

The water began to drastically improve when the city's government launched a full-scale recovery program in 2012. Authorities have since spent 3.8 billion yuan (\$546.5 million) to clean up the river.

The first phase, from 2012 to 2013, created a decontami-

nation system, constructed silt-processing facilities, and renovated shutter dams, while the second phase, between 2014 and 2016, focused on building wastewater treatment plants.

The third phase, from 2016 to 2025, will develop regulations to separate rainwater and wastewater. It will also curb agricultural runoff, authorities said.

About 70 percent of the Nanming's water is classified as Grade III, clean enough for swimming or aquaculture, or Grade IV, meaning it is OK for industrial use or other purposes that do not bring it into direct contact with humans.

Improving the river's water is part of three major environmental protection projects that the government is undertaking with an investment of more than 40 billion yuan.

Guiyang has been working to expand its forest coverage. The plan calls for increasing coverage from 49 to 60 percent by 2020.

In 2004, Guiyang was recognized as China's first national-level forest city by the State Forestry Bureau, which has since become the National Forestry and Grassland Administration. The city is surrounded by 162,000 hectares of forest.

"Ecological revitalization encourages shared benefits," Gao Xiaowen, deputy director of the Guiyang Ecological Civilization Construction Committee, said in an earlier interview. "Soon, local people will see how they can share in the city's reconstruction plan."

Li Hanyu and Che Weiwei contributed to this story.

## Advertorial

# BBAC redefines manufacturing in a digital, flexible and green way

By **CAO YINGYING**  
caoyingying@chinadaily.com.cn

The all-new Mercedes-Benz A-Class L, the 2 millionth locally built Mercedes-Benz model, went offline from the MFA facility of Beijing Benz Automotive Co Ltd, a joint venture of Daimler and BAIC, this Wednesday.

Superbly crafted, the all-new Mercedes-Benz A-Class L is a representative creature of BBAC, where the manufacturing is being redefined in a digital, flexible and green way.

"The future of manufacturing is here," said Arno van der Merwe, president and CEO of BBAC.

"We are developing a new manufacturing operation aligned with the Mercedes-Benz global production system and underpinned by three key elements: digitization, flexibility and green," he added.

"In this entirely new manufacturing world, everything is connected."

BBAC is already digitalizing its entire value chain from product designs to research and development, logistics, production, quality and financial services. All the steps are digitally synchronized to ensure perfect execution and complete alignment with the customers' needs.

To meet the increasingly personalized needs of customers, the new plant has adopted a flexible production model that combines people, machines and production processes allowing the automaker to produce sedans and SUVs on the same production line, even in both pure electric and traditional combustion engine configuration in the future.

He said intelligent manufacturing is not the end of this particular journey. The company not only wants to provide fascinating and inspirational products, but also to help move the world along toward a greener future.

By extensively applying clean energy technologies, BBAC said it has moved to a production model of low consumption, low emissions and high efficiency.

The latest energy-saving technologies — such as ground source heat pumps, photovoltaic systems and smart lighting systems — have been installed throughout the plant, cutting power consumption by an estimated 14,000 megawatt hours each year.

China has been the largest single market for Mercedes-Benz since 2015.

In the first 10 months of this year, the German automaker delivered more than 560,000 vehicles to Chinese customers, sustaining double-digit growth year-on-year.

Hubertus Troška, board member of Daimler AG responsible for Greater China, said this is an "encouraging result", with the luxury brand's success in the huge market largely attributed to locally produced models.

He added that the vehicles rolling off the BBAC production lines has accounted for more than 70 percent of the total sales of Mercedes-Benz in China.

Back in 2005, the E-Class model rolled off the assembly line as the first Mercedes-Benz model at BBAC. It took the joint venture

more than 10 years to locally produce the 1 millionth vehicle in 2016.

Two years later, on Wednesday, BBAC celebrated the rolling off the production line of the 2 millionth vehicle, showcasing the extraordinary growth of the business and its rapid development in the world's largest auto market.

"In just 13 years, BBAC has been able to realize the ideas of 'high speed' and 'high quality' with a world-class plant, five of Mercedes-Benz's best-selling worldwide

models, and recognition from 2 million customers. We are setting the standards for manufacturing excellence with a new era of manufacturing language that embraces 'high speed and high quality'," said Chen Wei, senior executive vice-president of BBAC.

China is now also the world's largest market of the C-Class, E-Class, GLC and GLA models, which are the full lineup of the locally produced BBAC portfolio. The all-new A-Class L sedan is the fifth

locally produced Mercedes-Benz.

According to the carmaker, the body of the all-new long wheelbase A-Class is manufactured with an automation rate of 99 percent, using more than 650 robots.

BBAC's efforts to promote intelligent and innovative manufacturing have won accolades from local authorities.

The company has been recognized as a Sino-German Intelligent Manufacturing Cooperation Demonstration Pilot Project by the Ministry of Industry and Information Technology. This honor further reinforces BBAC's leadership in premium manufacturing.

Xu Heyi, chairman of Chinese State-owned carmaker BAIC, said: "As the core practitioner of high-end manufacturing and high-end products, BBAC shoulders the important mission of leading Beijing's automotive industry to continue to transform and develop in a high-grade, high-precision and advanced direction."

"In the face of today's technological revolution with many peaks, our industry is constantly improving and opening up. BBAC will continue to adhere to the development path of high-end manufacturing, high-end products, to deepen our integration with emerging industries," Xu added.

In the future, BBAC said it will continue to adopt modern management processes and stringent quality systems, and constantly refine its advanced craftsmanship and manufacturing processes.
